

# ya-pandoc-template

Yet Another Pandoc Template - a very simple system for quick cross-format Pandoc translation

## What is this even?

It's just a Makefile built around the amazing Pandoc document converter that transforms all Markdown (`.md` filetype) files in the current directory into one of several *stylized* document formats, customized using Pandoc's support for custom templates. This includes

- > stylized LaTeX Beamer presentations (via `templates/custom.beamer`),
- > stylized LaTeX manuscripts (via `templates/custom.latex`),
- > stylized double-column LaTeX manuscripts (via `templates/custom-double.latex`), and
- > stylized HTML presentations using reveal.js (via arguments to Pandoc)

## Installation

1. Install the necessary software:

- Install Pandoc
- Install the Pandoc extension `pandoc-citeproc` (TODO this may not be necessary?)
- Install LaTeX if you don't have it already. Some ways to get it include TeX Live and MiKTeX.
- Install GNU Make if you don't have it already.

– Linux likely already has it installed. For OS X you might have to install Xcode Command Line Tools from Apple's developer site. For Windows, installing Make as part of the Cygwin environment is probably the easiest way to get it.

- Install the reveal.js library into a folder at `$HOME/.pandoc/revealjs`. This may not be necessary, but in the past, I couldn't get reveal.js to be used out of the box.

2. Clone a copy of this repo, e.g.

```
git clone https://github.com/asoplata/ya-pandoc-template.git
```

3. Copy the `templates` folder to your `$HOME/.pandoc` folder.

4. Copy the `Makefile` file to the same folder that contains your Markdown files. Note that you will have to do this for every project you want to use these templates in... but that means you now have a consistent, easy, and reproducible way to build all your documents!

5. Now you're ready to Use the templates!

## Usage

- Once you've got the following in your folder:
  - your Markdown files
  - the Makefile from this repo
  - (optional) a `bibliography.bib` BibTeX file
- Then, open a terminal in the folder and type **one** of the following commands based on what

61 kind of output you want:

62 `make beamer`

63 `make beamer_bib`

64 `make html`

65 `make html_bib`

66 `make manuscript`

67 `make manuscript_bib`

68 `make manuscript_double`

69 `make manuscript_double_bib`

- 70 • Note: Just to be clear, this builds every Mark-  
71 down file in the directory where the Makefile is  
72 run **into a single resulting document**.

## 73 BibTeX usage

- 74 • The “recipes” that end in `_bib` mean that Bib-  
75 TeX will be also be run. However, if you want  
76 BibTeX support, be aware:
- 77 1. you need to include a `bibliography.bib`  
78 file in the current folder, and
  - 79 2. the build process will **fail** if you do not  
80 have a file of that type present.

## 81 Customization / styling

82 If you want to see where and what I’ve stylized, in-  
83 cluding where you can easily make your own changes,  
84 search the template files for the string “ya-pandoc-  
85 template”.

## 86 Acknowledgements

- 87 • This would have been impossible without some  
88 great blog posts on using Pandoc for academia:

89 – [http://kieranhealy.org/blog/archives/  
90 2014/01/23/plain-text/](http://kieranhealy.org/blog/archives/2014/01/23/plain-text/)

91 – [http://jeromyanglim.blogspot.com/2012/  
92 07/beamer-pandoc-markdown.html](http://jeromyanglim.blogspot.com/2012/07/beamer-pandoc-markdown.html)

93 – I’m definitely forgetting some, but virtually  
94 none of the original implementation of this  
95 is original. This is NOT MY ORIGINAL  
96 IDEA.

- 97 • That said, Copyright Boston University 2017,  
98 License GPLv3 (when I figure out how to declare  
99 that correctly).

- 100 • If you want a much more serious, feature-rich  
101 approach to this kind of thing (or are frustrated  
102 by the limitations of this), I suggest the Pandoc  
103 fork ScholDoc which is the engine for Scholarly-  
104 Markdown.

## 105 Postscript

106 This supersedes my earlier Acadoc method.
